

## ABSTRACT OF THE DISCLOSURE

The invention pertains to a hand-held pet bathing utensil that incorporates a nozzle consisting of an array of rigid tubular extensions that can deliver water directly to the animal's skin. This action displaces the entrapped air in the animal's fur coat that acts as insulation, thereby quickly and easily saturating the fur coat and substantially reducing the effort in pet bathing previously required. The utensil can be connected to a garden hose or a shower and it's proportional flow regulating valve conserves water and energy and allows the user to efficiently bathe their pet with warm water, indoors or out.
